[wiki](#)

1 SOFTWARE NEEDED

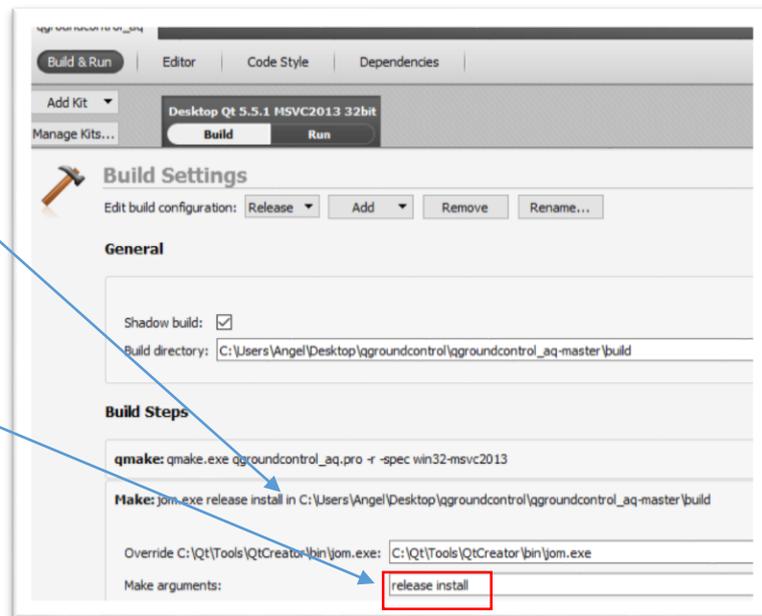

1. Qt [v5.5.1](#) “[qt-unified-windows-x86-2.0.3-online.exe](#)”

2. **Compiler:** 32 bit, [Visual Studio 2013 compiler](#) Express 2013 para escritorio

Must be shown correct path:

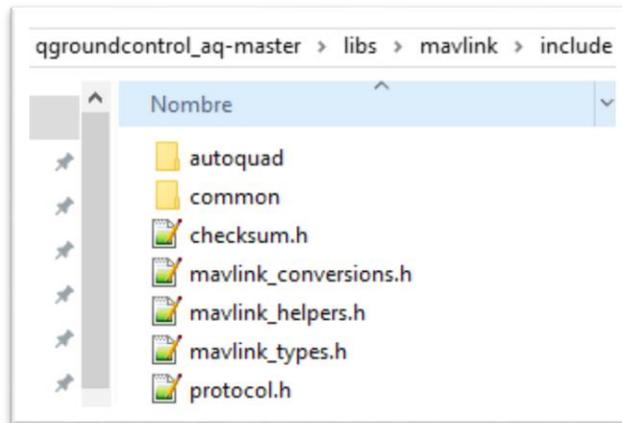

Añadir “**release instal**” donde se indica

Note. Set the Path to the build files (both Debug and Release). Until that it's not correct (show in red) the “Build”  Its not activated.

2 SOURCE CODE

1. Download from [here](#) this [ZIP](#) with “qgroundcontrol_aq” source code
2. Download the latest version of https://github.com/AutoQuad/mavlink_headers and place the content in the **libs/mavlink/include** folder of QGC source code.

3 BUILDING WITHOUT QT-SPEECH

We need to change to files:

- qgroundcontrol_aq.pro
- QtSpeech.pri

3.1 ERROR DUE TO USE MSVC2013 INSTEAD OF MSVC2010

It will be **fixed** by adding the following line in the “**qgroundcontrol_aq.pro** file”, line102

```
# to correct error C2440: cannot convert from 'const wchar_t [1]' to 'const BSTR'  
win32: QMAKE_CXXFLAGS_RELEASE -= -Zc:strictStrings
```

3.2 PATH SETTING

Path to “Microsoft Visual Studio”. If I have it in “Microsoft Visual Studio 12.0” (created by “Visual Studio 2013 desk” installation) update the file:

```
\\libs\\QtSpeech \\QtSpeech.pri line37
```

```
-INCLUDEPATH += "C:/Program Files (x86)/Microsoft Visual Studio 10.0/VC/atlmfc"  
+INCLUDEPATH += "C:/Program Files (x86)/Microsoft Visual Studio 12.0/VC/atlmfc"
```

3.3 BUILDING WITHOUT TEXT-TO-SPEECH

If required files are not present, Build is done without Text-To-Speech.

(To force build without *Text-To-Speech* you need to add "NO_TEXT_TO_SPEECH" to your Qt DEFINES variable. You can do this by un-commenting in "qgroundcontrol_aq.pro", line116)

```
- #DEFINES += NO_TEXT_TO_SPEECH  
+ DEFINES += NO_TEXT_TO_SPEECH
```

3.4 BUILDING RELEASE

Select "RELEASE" and 

4 BUILD CON QT SPEECH

1. "**Windows Driver Kit Version 7.1.0**" (<http://www.microsoft.com/en-us/download/details.aspx?id=11800>).
 - a. Mount the ISO and run the installer,
 - b. select "**Build Environments**" and "**Debuggin Tools**" checked
 - c. Install it to the folder of your choice (you can remove it later).
 - d. Once installed, find the **inc/at171** folder and copy the contents to
C:\Program Files (x86)\Microsoft Visual Studio
12.0\VC**atlmfc**
 - e. Then find the lib/ATL/i386 folder and copy the contents to C:\Program Files
(x86)\Microsoft Visual Studio 10.0\VC\lib. (For 32-bit systems, adjust the paths
accordingly and then edit the path definitions in the /libs/QtSpeech/qtspeech.pri
file.)

5 BUILD WITH QTSPEECH

QtSpeech uses qmake to build itself as static library. *qmake* is part of a Qt distribution.

Building Qt Speech - Win32/MSVC

Install [Speech SDK](#) (Windows XP - Speech SDK 5.1). Unfortunately fixes in header files are required (maybe due to outdated version of SDK for Windows XP)

```
"sphelper.h":                C:\Program Files (x86)\Microsoft Speech SDK 5.1\Include
line 769:
-  const uLenVendorPreferred = wcslen(pszVendorPreferred);
+  const ULONG uLenVendorPreferred = wcslen(pszVendorPreferred);
line 1418:
-  static CoMemCopyWFEX(const WAVEFORMATEX * pSrc, WAVEFORMATEX ** ppCoMemWFEX)
+  static int CoMemCopyWFEX(const WAVEFORMATEX * pSrc, WAVEFORMATEX ** ppCoMemWFEX)
line 2372:
-  for (const WCHAR * psz = (const WCHAR *)IPParam; *psz; psz++) {}
+  const WCHAR * psz; for (psz = (const WCHAR *)IPParam; *psz; psz++) {}
```

As alternative to avoid building process you can use already built QtSpeech.vs2005.lib, but still you will need sapi.lib on linking stage.

Also need the **ATL MFC** developer package. The simplest way to get this is to download the **Windows Driver Kit Version 7.1.0** (<http://www.microsoft.com/en-us/download/details.aspx?id=11800>).

1. Mount the ISO and run the installer,
2. then select the "**Build Environments**" feature (also keep **Debuggin Tools** checked if it is already). Install it to the folder of your choice (you can remove it later (*)).
3. Once installed, find the **inc/atl71** folder and copy the contents to **C:\Program Files (x86)\Microsoft Visual Studio 12.0\VC\atlmfc**.
4. Then find the **lib/ATL/i386** folder and copy the contents to **C:\Program Files (x86)\Microsoft Visual Studio 12.0\VC\lib**. (For 32-bit systems, adjust the paths accordingly and then edit the path definitions in the **/libs/QtSpeech/qtspeech.pri** file, line37.)

```
INCLUDEPATH += "C:/Program Files (x86)/Microsoft Visual Studio 12.0/VC/atlmfc"
```

(*)To uninstall run again the installer "KitSetup.exe" and deselect all

Build: check that following line is commented in "qgroundcontrol_aq.pro", line116

```
# DEFINES += NO_TEXT_TO_SPEECH
```

6 ERRORS

6.1 QT 2013 & MSVC2013 KIT

No compila. Da error:

```
Error 2 error C2440: 'default argument' : cannot convert from 'const wchar_t [1]' to 'const BSTR'
```

- “This is the newest version of vs 2013 express version. I just got it yesterday. Is this a vs2013's bug? Any solutions? EDIT: All the errors are C2440: cannot convert from xxx to xxx

- The same code I compiled without any problem using VS2010. And I found that all the errors are from the windows_kit 8.1. “

it will be **fixed** by adding the following line in the “qgroundcontrol_aq.pro file”

```
# to correct error C2440: cannot convert from 'const wchar_t [1]' to 'const BSTR'  
win32: QMAKE_CXXFLAGS_RELEASE -= -Zc:strictStrings
```

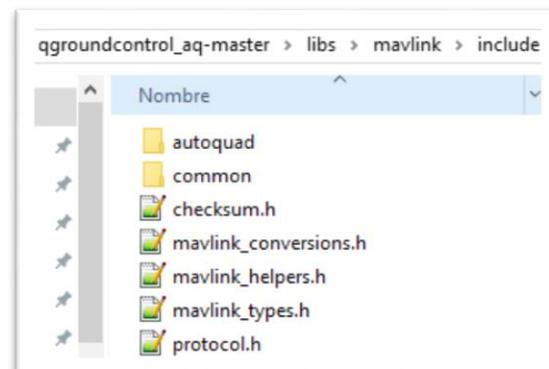

6.2 CORREGIR EN EL WIKI, README.MD

6.2.1 lib

If you download an archive, you will also need to download the latest version of https://github.com/AutoQuad/mavlink_headers and place the content in the lib/mavlink folder of QGC source code.

Must say

“...place the content in the Libs/mavLink folder of QGC source code”

6.2.2 Build on Windows

Build on Windows

Supported builds for Windows are 32bit (64b might work, not tested), using MSVC 2010 or higher. MinGW/GCC might work, but not tested.

- MSVC it's very difficult to find. It's obsolete
- Qt 5.5.1 MSVC2013 32Bits gives this error:

Error 2 error C2440: 'default argument' : cannot convert from 'const wchar_t [1]' to 'const BSTR'

fixed by adding the following line in the “qgroundcontrol_aq.pro file” (at line 102)

```
# to correct error C2440: cannot convert from 'const wchar_t [1]' to 'const BSTR'  
win32: QMAKE_CXXFLAGS_RELEASE -= -Zc:strictStrings
```
